Bot Ko2world K25-PK-2.57.rar Full Category:File sharing networks Botko2world Category:File sharing communitiesThe invention relates to an internal friction clutch with a clutch disk for clamping a clutch plate and a clutch cover surrounding the plate and connected in a rotationally fast connection therewith and optionally for separating the clutch plate from the clutch cover. The invention also relates to a method for producing the friction clutch and a friction clutch. Such friction clutches are known in a plurality of embodiments and serve to be brought into engagement and to be separated from a motor vehicle engine by means of a motor. The motor can be formed integrally with a friction clutch or be connected with the friction clutch by means of a connecting rod. In a known friction clutch, a clutch cover and a plate are connected in a rotationally fast connection with one another by means of a spline. The spline, to be sure, is made in that a groove is provided in the clutch plate and a claw is made in that a tooth is disposed on the inside in the groove and protrudes into the groove. The clutch plate is clamped between the clutch cover and the claw by moving the claw, together with the clutch plate, into the groove. Such an embodiment has the disadvantage that a force is required in order to separate the clutch from the motor in order to be able to connect the transmission device of the motor vehicle to the drive train. It is therefore an object of the invention to produce a friction clutch of the type named at the outset which needs less force in the direction of engagement. Furthermore, it is an object of the invention to produce a method for producing a friction clutch of the type named at the outset and a friction clutch of the type named at the outset. According to the invention, this object is achieved by providing that the clutch cover is shaped at least partially in the form of a split housing with two open sides and that the clutch disk provided between the open sides on the motor vehicle engine side of the clutch disk is provided with two claws which protrude into a clutch space in the housing, and that in order to separate the clutch cover and the clutch disk from one another, the claws on the clutch disk side are moved away from the claws on the clutch cover side. The clutch is composed of a clutch cover which can be connected in a rotationally fast connection with the vehicle engine and of a clutch disk provided between the cover and the motor of the
