What's all this? A: I strongly recommend not to use SATA, unless you have a very specific reason to do so. SATA was not designed to be used as a generic SATA bridge, and in general I would never use it for any purpose. If you do want to use it for a bridge, go read this. Lubricant products, for example fluids, greases, oils, pastes, powders, gels and the like, are generally provided in containers or packaging which are intended for retail, industrial, institutional and/or home use. In such packaging, it is usually desired to present the packaged product to the user in a manner that indicates the nature and purpose of the product. In many cases, the container or packaging includes visual materials, such as printed information, graphics, pictures, or combinations thereof, which alert the user to the nature of the packaged product and its intended use.

There are several problems that exist with the current methods of packaging lubricant products. One is that the printed information, graphics, pictures, and the like are often not very conspicuous or easily noticed. In some cases, the printed information is relatively small, and thus it can be easily overlooked. In addition, the information

Power Card (CoRUM) .1.
Field of the Invention The present invention is generally related to an image forming apparatus, and more particularly to a structure of an image forming apparatus that is equipped with a stepping motor. 2.

Discussion of the Background A conventional image forming apparatus such as a digital multi-function machine, facsimile machine, copier, printer, is

equipped with a system configuration board (hereinafter, referred to as a system board) that is disposed in the main body of the image forming apparatus. The system board is structured to control the operation of each portion of the image forming apparatus. The system board is electrically connected to various types of devices such as a power source board, a control board, etc. It is desirable that the image forming apparatus be improved in terms of low power consumption since power is supplied from a commercial AC power source. In order to reduce power consumption of the image forming apparatus, it is important to lower the operating speed of the stepping motor, as well as cut off the power supply from the stepping motor. The power consumption of the stepping motor can be reduced if the rotation speed of the stepping motor is lowered. However, the stepping motor cannot be stopped even if the power supply to the motor is cut off.

Therefore, it is desirable to determine whether the stepping motor is in a state of power-on or power-
